

Target 50%

Target 60%

Target 70%

Red % = fraction of runs reaching the target, when <100%. Bar heights are conditional on reaching the target (only successful seeds are averaged), which favors methods that reach it rarely — e.g. at $\alpha=0.1$ /target 70% FedHAD reaches it in 4/10 runs vs. FedAvg's 6/10; at $\alpha=0.01$ /target 60% FedHAD reaches it in 2/10 vs. FedAvg's 3/10.
